Top 10 Physical Security Solution Providers - 2019

Security is one of the driving forces for smooth operations of any enterprise. A fully implemented plan is the only way to ensure the protection of information, software, and user access network and helps prevent a breach in the security protocols. Physical security is an essential facet of security planning, as it ensures the safeguarding of all tangible assets including building sites, equipment, machinery, and also humans. It also creates a safe environment of work and prevents work operations to be hindered by vandalism, theft, or any man-made catastrophes.

Security providers are now taking their solutions a notch higher by diverting from conventional methods of electric fences and turnstiles, by adding high-tech innovations into them. These include the implementation of audio and motion detectors, tampering alerts through beacons, RFID badges, and radio frequency. These alerts help security personnel to be notified in real-time and address any potential threat immediately. Intelligent advents of facial and license plate recognition are also progressive automated methods of reinstating security on a greater level in several physical security systems like school campuses, prisons, and secure facilities. The use of AI-powered security robots and automated drones has also helped elevate physical security by providing active surveillance and instant emergency response.

This coalescence of physical security with innovative AI-powered technology is a turning point in the security scenario of enterprises. To help find the best solutions, a distinguished panel of prominent CEOs, CIOs, VCs, and analysts, along with Enterprise Security Magazine editorial board has assessed and streamlined the companies offering ground-breaking solutions in physical security. We present to you "Top 10 Physical Security Solution Providers - 2019."

Unlimited Technology

recognized by **SECURITY** magazine as

TOP 10
PHYSICAL SECURITY
SOLUTION PROVIDERS - 2019

An annual listing of 10 companies that are at the forefront of providing physical security solutions and transforming businesses

---

Company:
Unlimited Technology

Description:
Providing reliable security solutions, utilizing state-of-the-art technologies to secure the infrastructure

Key Person:
John Palumbo
President

Unlimited Technology
Reliable, Scalable, and Secure Infrastructure

In today's connected and fast-changing technology environment, infrastructure security is no longer limited to setting up video systems and deploying a monitoring team. Organizations need to reform their security strategy by shifting the spotlight from a reactive to a proactive approach. In a busy economy marked by budget constraints, outsourcing their security project to a reliable solutions partner, without a doubt, is a smart choice for an organization. New Jersey-based Unlimited Technology offers end-to-end security solutions ranging from integrating security equipment to implementing cybersecurity frameworks to device health monitoring using proven technologies. For more than 20 years, Unlimited Technology has offered companies across the globe with pioneering access control and video management systems built on state-of-the-art technologies. Effectively, the company's integrated approach allows its clients to scale the physical as well as cyber security capability with new technologies.

Unlike other physical security solution providers that only install card readers and cameras, Unlimited Technology's complete turnkey security solutions cover everything from idea to execution and add more value through ongoing maintenance services. Before approaching its clients with a solution, Unlimited Technology spends a significant amount of time in comprehending their security needs and building a robust security plan. The solutions are delivered based on the needs of every individual client in a customized manner.

John Palumbo, President of Unlimited Technology, highlights that internet-facing devices deliver unique benefits in terms of flexibility and adaptability but are always at risk of cyberattack.

To counteract the uncertain threats proactively, Unlimited Technology has introduced Exero, a provider- or integrator-agnostic monitoring platform that collects and manages data from IP-enabled devices. Exero provides real-time information from connected devices and systems to the IT security teams through the visualization-based dashboard. The insights provided by Exero allow Unlimited Technology and the client to track the behavior and health of all the connected devices and be in complete command of their physically networked environments. By "listening for noise and tuning for silence," as Palumbo says, the maintenance and support team can identify issues such as a denial of service, weak passwords, or faulty edge devices.

Leveraging an internal, specialized cybersecurity team, Unlimited Technology offers security managed services to supervise the critical infrastructure for anomalies, threats, and breaches. The services allow companies to identify their security strengths and weaknesses, and take effective measures for the complete protection of their infrastructure. Besides offering remote support, antivirus and firewall management, monitoring devices and smart fire alarms, the skilled team regularly visits the clients' site to inspect equipment and devices.

Unlimited Technology has served numerous multinational clients including a client with a multi-million dollar installation of access control systems, IP-based video management, and audio-video, among others. What makes the firm a champion is their comprehensive security solutions strategy that supports the latest standards and aligns with the evolving technology. Unlimited Technology addresses the challenges of new software, modern edge devices, and software incompatibilities by testing solutions in a sandbox/ test environment

John Palumbo

> **Before approaching its clients with a solution, Unlimited Technology spends a significant amount of time in comprehending their security needs and building a robust security plan**

before beginning production. This secure approach saves the implementation process from causing any damage to the existing environment.

With innovation in its DNA, Unlimited Technology is continuously developing new features that go beyond video monitoring and access management. Throwing light on the future of infrastructure security, Palumbo concludes, "We see massive adoption of security managed services in the coming days, and we are fully prepared to meet the growing demand."
